Introduction to HDL

Hardware Description Language (HDL) is used to describe hardware (usually digital) circuits. It allows multiple level of circuit abstraction, thus a synthesis tool is usually required to actually figure out what a piece of code really represents on hardware. With a decent synthesis tool, it can be a good alternative to schematic drawing as a design entry method. Why is this good? Keeping track of clearly documented text files for a design is much better compared to library-based schematic file with specific format (plus you get to use the cool SCMs like git 😛). Of course, a really good synthesis tool is necessary to create an accurate hardware design netlist.

The two most popular language in this category are VHDL (***V**ery High Speed Integrated Circuit* **HDL**) and Verilog HDL. Both languages are being used extensively although the trend seems towards Verilog (http://www.opencores.org and Icarus). Personally, I'd prefer VHDL for it's completeness and strong type-casting feature. And no, I'm not saying that VHDL is better than Verilog... I was just stating my *personal* preference. I have used both languages and that's how I feel. But, I do think that Verilog has its merits like the fact that it has much closer link to simulation and simpler syntax. Bottom line, choose one that you're comfortable with. But, if you're working for a small/medium-sized company which are not rich enough to buy support for both languages, you don't get to choose. Use whatever they give to you, or get another job. So, the REALLY bottom (under-bottom?) line, get to know both. Should I go on with the other not-so-known languages? 😳

VHDL Background

```
1981    Initiated by US DoD to address hardware life-cycle crisis
1983-85 Development of baseline language by Intermetrics, IBM and TI
1986    All rights transferred to IEEE
1987    Publication of IEEE Standard
1987    Mil Std 454 requires comprehensive VHDL descriptions to be delivered
with ASICs
1994    Revised standard (named VHDL 1076-1993)
2000    Revised standard (named VHDL 1076 2000, Edition)
2002    Revised standard (named VHDL 1076-2002)
2007    VHDL Procedural Language Application Interface standard (VHDL
1076c-2007)
2009    Revised Standard (named VHDL 1076-2008)
```

Verilog Background

```
199512 - Verilog HDL became IEEE Std. 1364-1995
2001 - revised IEEE Std. 1364-2001
2005 - minor revision

extension => SystemVerilog
```

```
2005 - IEEE standard 1800-2005
```

Describing Hardware

Coding for Synthesis

As mentioned earlier, a good synthesis tool is required to translate HDL codes into hardware design netlist. What's a netlist? Well, it's a list of nets (a.k.a. interconnections) between circuit elements. It's exactly what you draw when you create a schematic but, in list form (conveniently in a text file). So, one way to make life easier for the synthesis tool (which is merely a computer program that is not exactly a genius ;P), we can write the HDL code in certain way so that it is clear to the tool what we actually want in the design. This is called coding for synthesis. And this topic, on its own, has created a lot of discussions among HDL users.
