FreeBSD Tweaks

Maybe useful to some...

Git

1. 'git log' output does not show colorized output
   - can see the escape sequence
   - so, as user, type

   ```
   git config --global core.pager "ls -r"
   ```

Network Configuration

Note DHCP client is dhclient - simply run `dhclient <interface>` when booting to console and using something like USB tethering.

Configure (wireless) network interface (in case was not done during installation)

- FreeBSD has network interface name - based on the driver name (e.g. sis, re)
  - to find this, use `pciconf -lv`
- for normal wired connection (e.g. re0), add to 'rc.conf'

  ```
  ifconfig_re0="DHCP"
  ```

- for a wireless connection (e.g. ath0), add in

  ```
  wlan_ath0="wlan0"
  ifconfig_wlan0="DHCP"
  ```
